Streamlit Extras in Python

Last Updated : 23 Aug, 2022

In this article we will introduce ourselves with the Streamlit-extras module, which can easily give some special touch to our Streamlit apps with the least amount of code possible.

What is streamlit-extras module?

Streamlit-extras is a special module that builds upon the traditional Streamlit module. It adds the features of the Streamlit module and adds some 'extra' features to it. It takes the help of some underlying HTML, CSS and JS, but developers just needs to write Python code to use all of its features. Some of it's most usable features will be discussed here today.

Required Modules

We will be using two modules here, **streamlit** and **streamlit-extras**. To install both of them using pip write the following command in the terminal.

```
pip install streamlit

pip install streamlit-extras
```

Creating a simple Streamlit WebApp:

```
import streamlit as st

st.set_page_config(page_title="This is a Simple Streamlit WebApp")
st.title("This is the Home Page Geeks.")
st.text("Geeks Home Page")
```

Firstly we are importing the module streamlit with alias stm, then giving a page title using the **set_page_config()** method of streamlit module, user can give any page title they want. The same will be visible in the Title Bar of the tab. Then using **title()** method to pass a title to text we will write afterwards. Then adding a simple text using **text()** method.

Output:

Adding vertical space in our WebApp:

We will now add 'n' amount of vertical spaces in our web app using the **add_vertical_space()** function.

```
import streamlit as st
from streamlit_extras import add_vertical_space as avs

st.set_page_config(page_title="This is a Simple Streamlit WebApp")
st.title("This is the Home Page Geeks.")
st.text("Geeks Home Page")

# Your Before putting space
st.text("The text after which we will put spaces")

# Putting 4 vertical spaces
avs.add_vertical_space(4)
# Your After putting space
st.text("The text after putting spaces")
```

Here we are using the **streamlit_extras** module for the first time to import **add_vertical_space** class using alias **avs** which we are then using to call the **add_vertical_space()** function (The name of the class and the function is same, so we have to write them twice.) Passing a value of 5 means we want 5 vertical spaces. Writing a text before and after the space to show that how it looks and how much space it gave.

Output:

Adding annotated texts in our WebApp

What are annotations?

An annotation is a note or comment that is added to a text to offer commentary or criticism on a specific passage. Annotation can also be used to describe the process of adding annotations. Scholarly articles or literary works that are being analyzed frequently have annotations added.

```
import streamlit as stm
from streamlit_extras import add_vertical_space as avs
import streamlit_text_annotation
import streamlit_text_annotation as sta

st.set_page_config(page_title="This is a Simple Streamlit WebApp")
st.title("This is the Home Page Geeks.")
st.text("Geeks Home Page")

# Adding the text after which we will put spaces
avs.add_vertical_space(5)
# Your After putting space
st.text("The text after putting spaces")

# Declaring the
st.annotated_text(
    ("This",
    "", "#faa"),
    ("is",
    "verb", "#afa"),
    ("a",
    "Det", "#fda"),
    ("Simple",
    "adj", "#fda"),
    ("Streamlit",
    "noun", "#afd"),
    ("WebApp",
    "noun", "#afd"),
    ("Geeks",
    "noun", "#afd"),
    ("Home",
    "noun", "#afd"),
    ("Page",
    "noun", "#afd"),
    ("Geeks",
    "noun", "#afd"),
    ("Text",
    "noun", "#afd"),
    ("Annotation
```
